

IN THE CLAIMS:

1. (Previously Presented) A composition for hair comprising a block copolymer (A) represented by the following general formula (1):

General formula (1)

[wherein R¹ independently designates monovalent hydrocarbon groups free of aliphatic unsaturation, hydroxyl groups, or siloxy groups;

Y¹ designates a divalent organic group;

R² independently designates hydrogen atoms, hydroxyl groups, substituted or unsubstituted monovalent hydrocarbon groups, alkoxy groups, or groups represented by the following formula:

(wherein Y⁴ is a hydrogen atom or a substituted or unsubstituted monovalent hydrocarbon group);

"a" is 1 or a greater integer;

"b" is 1 or a greater integer;

"x" is 0, 1 or a greater integer;

"c" is 1 or a greater integer;

AB The hair prepn.s., which prevent and repair hair damage due to heat of dryers, permanent wave prepn.s., hair dyes, hair bleaches, etc., and maintain softness and smoothness of hair, contain (a) amphipathic amide lipids (Markush structures of 4 types are given), (b) organopolysiloxanes having amino-substituted polysiloxane and polyoxyalkylene chains, and optional (c) quaternary ammonium salts or tertiary amines (Markush structures are also given). Thus, a hair conditioner was formulated containing
MeO(CH2)3NHCO(CH2)6CHMe(CH2)4CHMe(CH2)6CONH(CH)3OMe,
Me2CHCH2O(C2H4O)54[CH2CHMeCH2(SiMe2O)48[SiMe[(CH2)3NHCH2CH2NH2]O]2SiMe2CH2
CHMeCH2O(C2H4O)54]6CH2CHMe2, and stearyltrimethylammonium chloride.

AB It is intended to provide: (1) a hair care composition which can impart a moist feel, a smooth texture, a favorable feel of film thickness and favorable combining properties to the hair, by which these effects can be sustained even after repeatedly brushing and which gives neither any squeaky feel to both of dry hair and wet hair nor any stickiness to dried hair; and (2) a hair care composition which is excellent in foaming and cleansing performances and by which a smooth texture and favorable combining properties can be sustained even after repeatedly shampooing. A hair care composition is characterized by containing from 0.01 to 10% by mass of a specific polyorganosiloxane-polyoxyalkylene block copolymer.

AB	Disclosed is a cosmetic hair composition which is effective in preventing the hair from creaking during rinsing in a water stream, and in improving the flexibility and smoothness of the hair being rinsed and which thereby prevents the hair from being damaged by hair entanglement during rinsing. It contains organopolysiloxane having an amino-modified organopolysiloxane chain and a polyoxyalkylene chain and at least one cationic surfactant selected among compds. represented by the general formulas [R1(R2)(R3)NR4]+X- and R5N(R6)R6 (R1, R2, R3, R4 = C8-35 alkyl, C1-5 alkyl, hydroxyalkyl, etc.; X- = halogen ion or organic anion; R5 = C5-35, etc.; and R6 = C1-22 alkyl, etc.). A hair conditioner containing an organopolysiloxane having amino-modified organopolysiloxane chain and polyoxyalkylene chain (FZ 3789) 1, behenyltrimethylamine 1, stearamidopropyltrimethylamine 2, cetyl alc. 1, stearyl alc. 3, dimethylpolysiloxane (TSF 451-10A) 0.7, dimethylpolysiloxane (TSF 451-50MA) 0.3, lactic acid 2, malic acid 3, citric acid q.s., propylene glycol 0.5, fragrance/methyl paraben q.s., and water balance to 100 % was formulated.

AB Hair cosmetics contain (A) organopolysiloxanes having amino-modified polysiloxane chains and polyoxyalkylene chains and (B) ≥ 1 surfactants chosen from [R1R2R3R4N]+X- [≥ 1 of R1-R4 = C8-35 (O-, CONH-, O2C-, or CO2-containing) (OH-substituted) alkyl, alkenyl, acyloxy(polyethoxy)ethyl; other R1-R4 = C1-5 (hydroxy)alkyl, polyoxyethylene; X = halo, organic anion] and R5N(R6)2 [R5 = C8-35 (O-, CONH-, O2C-, or CO2-containing) (OH-substituted) alkyl, alkenyl; R6 = C1-22 alkyl, alkenyl, hydroxyalkyl]. The cosmetics improves hair flexibility and smoothness during rinsing. A conditioning shampoo was prepared from polyoxyethylene lauryl ether Na sulfate 10.0, stearyldimethylamine 0.1, cetyldimethylamine 0.1, cetanol 0.5, FZ 3789 (amino-

modified polysiloxane-polyoxyalkylene block copolymer) 1.0, TSF 451-10A (di-Me polysiloxane) 0.7, TSF 451-50MA (di-Me polysiloxane) 0.3, lauryldimethylamine oxide 1.0, imidazolinium betaine 1.0, cationic cellulose 0.5, propylene glycol 0.5, ethylene glycol distearate 2.0, aqueous citrate, perfume, methylparaben, and H₂O to 100 weight%.

AB A room-temperature curable organopolysiloxane composition comprises: (A) 100 parts of a diorganopolysiloxane $Y(3-m)Si(Rm)A(SiR2O)nSiR2OASi(Rm)Y(3-m)$ wherein, each R represents, an unsubstituted or substituted monovalent hydrocarbon group, each A represents an oxygen atom or a bivalent hydrocarbon group of 1 to 8 carbon atoms, each Y represents, independently, a hydroxyl group or a hydrolyzable group, m represents an integer from 0 to 2, and n represents a number which results in a viscosity at 25° for this diorganopolysiloxane of 20 to 1,000,000 mm²/s; (B) 0.5 to 20 parts of an organosilicon compound $R1aSiX4-a$, a partial hydrolysis-condensation product thereof, or a mixture of the two, wherein, each R1 represents an unsubstituted or substituted monovalent hydrocarbon group of 1 to 6 carbon atoms, each X represents, independently, a hydrolyzable group, and a represents an integer from 0 to 2; and (C) 1 to 60 parts of an oxyalkylene group-containing organopolysiloxane. Application of this composition to an underwater structure is able to generate an antifouling coating that is effective in preventing the adhesion and growth of aquatic organisms on the surface of the underwater structure, and displays superior long term endurance of this antifouling effect.

AB A quasi-solid state, dye-sensitized nanocryst. porous TiO₂ film, solar cell was fabricated using a novel gel network polymer electrolyte based on polysiloxanes with polyethylene oxide internal plasticized side chains and quaternary ammonium groups. The cell had good photoelec. conversion performance under 60 mW/cm² irradiation with a short-circuit photocurrent of 5.0 mA/cm² and open circuit voltage of 0.68 V. The energy conversion efficiency was 3.4 % and the fill factor, 0.60.

AB Makeup cosmetics contain 1-20 weight% nonaq. polymer dispersions in which polymers are dispersed in volatile silicones and 1-20 weight% aqueous polymer emulsions. Alternatively, the makeup cosmetics contain the nonaq. polymer dispersions 1-40, polyether-modified silicones 0.5-20, and inorg. powders 3-60 weight%. An O/W emulsion foundation containing 10 weight% aqueous emulsion containing 50 weight% Me methacrylate-Bu acrylate-2-ethylhexyl acrylate copolymer, 10 weight% nonaq. dispersion prepared by polymerization of Me methacrylate and Et acrylate in decamethylcyclopentasiloxane containing a polymerization initiator and a dispersion stabilizer, pigment powders, etc., showed good water and oil repellency and gave a good feel to the skin.

AB Silicone antifoaming agent of the present invention demonstrates excellent antifoaming effect with regard to aqueous foaming systems, and is especially suitable for use in conjunction with inks where it significantly suppresses development of cissing during use of ink. The silicone antifoaming agent is characterized by comprising a polyoxyalkylene-modified silicone that has (CH₂)_rO(C₃H₆O)_sQ and (CH₂)_rO(C₂H₄O)_sQ groups [Q = H, C1-18 alkyl, acyl, (substituted) amino, or NCO; r = 2-6; s = 5-50] and contains 10 to 200 diorganosiloxane units in one mol., said polyoxyalkylene-modified silicone satisfying the following conditions: $3 \leq E \leq 90$ and $0.01 \leq E/(E + P) \leq 0.45$, wherein P is the total number of C₃H₆O units and E is the total number of C₂H₄O units contained in one mol. such as reaction product of Me₃SiO(SiMe₂O)₅(SiHMeO)₇SiMe₃ with CH₂:CHCH₂O(C₂H₄O)₁₁Me and CH₂:CHCH₂O(C₃H₆O)₂₄Me.

 AB The invention relates to a method for treating polysiloxane-polyoxyalkylene
 block copolymers to control their surfactant properties. The method is
 characterized in that said copolymers are subjected to a superheated steam
 treatment to remove cyclosiloxanes and smelly propionaldehyde (formed during
 the reaction of polyoxyalkylene allyl ethers with SiH-terminated
 polysiloxanes).

AB The invention relates to a heat-developable photog. film suitable for laser imaging in printing platemaking and x-ray radiog. fields, wherein the heat-developable photog. film includes a first backcoat layer containing fluoro-surfactants and a second backcoat layer containing silicon-surfactants. The backcoat layers include a compound RfSO₃M (Rf = F-containing aliphatic; M = alkali metal) and a cellulose ester. The photog. film, suitable for printing platemaking, is processed at a transportation rate of 22-40 mm/s.

AB It is an object of the present invention to provide a practical lubricant composition excellent in wear resistance, extreme pressure properties and low friction properties for mech. friction sliding members. The present invention provides a lubricant composition containing, as the major ingredient, preferably a compound of triazine structure: (R-X)- m-D wherein D is a heterocyclic residue of 5- to 7-membered cyclic structure positioned at the center of the mol., or compound residue of cyclic structure with "m" radiating side chains; X is a single bond, group shown by NR1 (R1 is an alkyl group having a carbon number of 1 to 30 or hydrogen atom), oxygen atom, sulfur atom, carbonyl group, sulfonyl group, or a combination thereof forming a divalent coupling group; R is an alkyl, alkenyl, alkynyl, aryl or heterocyclic group; and "m" is an integer of 3 to 11.

AB A device for the controlled release over a prolonged period of time of a drug having antiprogesteric properties comprises a core containing a drug and optionally a membrane encasing said core, wherein said core and/or membrane is made of a siloxane-based elastomer composition comprising at least one elastomer and possibly a non-crosslinked polymer. The device is characterized in that the elastomer composition comprises poly(alkylene oxide) groups and that the poly(alkylene oxide) groups are present in the elastomer or polymer as alkoxy-terminated grafts of polysiloxane units, or as blocks, the said grafts or blocks being linked to the polysiloxane units by silicon-carbon bonds, or as a mixture of these forms. For example, an antiprogesteric-containing implants were prepared using a membrane and a core. The membrane was prepared using 99 parts silica-filled poly(dimethylsiloxane-co-vinylmethylsiloxane) and 0.6 parts of poly(hydrogen Me siloxane-co-dimethyl siloxane) crosslinker. The core was prepared using 100 parts of com. poly-(dimethylsiloxane-co-vinylmethylsiloxane) and 0.4 parts of poly-(hydrogen Me siloxane-co-dimethylsiloxane) crosslinker. The membrane tubes (length 50 mm) were swelled with cyclohexane and the cores were inserted. Cyclohexane was allowed to evaporate and ends were closed with a silicone adhesive. After 24 h the ends were cut to give 2 mm end-caps.

GI

AB Title siloxanes are represented by the general formula I and have mol. weight 400-100,000, at least one polyalkyleneoxy terminal group, and at least one reactive terminal group, where X = halogen or halogen-substituted Si; R' = H or (substituted) C₅-10 lower alkyl; R'' = R', halogen, hydroxy, or amine; l = 1-10; m ≥ 2; n = 1-4; p = 0-2; and q, r = 1-200. Thus, dimethylhydrogensilyl-terminated polydimethylsiloxane was reacted with triethylene glycol allyl Me ether and 4-(chloromethyl)styrene to give a reactive siloxane. Styrene and butadiene were polymerized to give a living polymer, which was reacted with the reactive siloxane to give a block polymer.

AB Title composition comprises (A) an aqueous emulsive resin 100, (B) a block copolymer 0.1-100 prepared by radical polymerization of monomers containing ≥50 wt% polyoxyalkylene (meth)acrylate in the presence of polymeric azo-compound initiator having the repeat unit of {CO(CH₂)₂C(CH₃)(CN)N:NC(CH₃)(CN)(CH₂)₂CONH(CH₂)₃Si(CH₃)₂[OSi(CH₃)₂]_x(CH₂)₃NH} (x: integer 10-500), and (C) a silica sol of ≤10 μm particle diameter 0.1-100 parts. Thus, a water-based coating was formulated. from fluoro resin-based white paint 100, block copolymer emulsion (33 wt% solids) 20 prepared by polymerizing M230G (methoxypolyoxyethylene glycol methacrylate) in the presence of VPS 0501 (polymeric azo compound), and Snowtex 40 (silica sol) 15 g, showing glossiness 77, weatherability 99%, contact angles 48 (water) and 138 (hexadecane), staining resistance (ΔL) -4, and good water resistance and storage stability.

AB Title aqueous emulsions contain 100 parts copolymers composed of (a) radically polymerizable monomers containing alkoxyethyl groups, (b) copolymerizable monomers, and (c) radically polymerizable surfactants Z(AO)nY (Z = organic group containing radically polymerizable double bond; AO = oxyalkylene; n ≥ 2; Y = ionic leaving group), and 0.1-30 parts block copolymer dispersants prepared by radical polymerization of monomers mainly composed of polyoxyalkylene (meth)acrylate in the presence of radical polymerization initiators bearing polydimethylsiloxane and azo groups in the main chains. Thus, radical polymerization of a mixture containing γ-methacryloxypropyltriethoxysilane 10, Me methacrylate 50, Bu acrylate 30, 2-hydroxyethyl acrylate 10, and Aqualon HS20 (reactive surfactant) 2 parts in H₂O gave an emulsion. Then, 100 parts of the emulsion and 15 parts of a block copolymer prepared by polymerizing M230G (methoxypolyoxyethylene glycol methacrylate) in the presence of VPS 0501 (polymeric azo compound) were mixed to give a storage-stable curable emulsion, which was applied on a primed Al plate and cured at room temperature for 1 wk to give coatings showing good solvent, stain, and weather resistance.

AB Disclosed is a nonaq. electrolyte soln.comprising a specific siloxane derivative of the following chemical formula (I) or (II), and at least one light metal salt such as an alkali metal salt. The siloxane derivative has a coefficient of kinematic viscosity at 25° of <5000 cSt, and a mean mol. weight of <10,000. The electrolyte solution has good chemical and thermochem. stability and the battery comprising it has high safety, and has good cell capabilities even at high voltage.

AB The two part tipping lubricant of this invention comprises water as the solvent. The lubricant is a silicone surfactant, which is nonionic and a good lubricating fluid. No sep. surfactant or lubricant is needed. The lubricant solution into which the catheter is dipped may also include low percentages of a solution stabilizer and an antimicrobial agent to clarify the solution and to inhibit microbial growth in the water solution Vitamin E or its derivative may also be used in the lubrication solution to prevent degradation of the solution

AB The organopolysiloxane compound having at least one group having the formula I wherein R3 is a divalent hydrocarbon group having from 1 to 20 carbon atoms, R5 and R6 are selected from a hydrogen atom or a group having the formula - (CnH2n+1) where n has a value from 1 to 30, R4 is selected from hydrogen atom, alkyl group or aryl group, d has a value from 0 to 150 and e has a value from 0 to 150, with the proviso that the value of d+e is greater than zero. These compds. reduce the amount of foam in hydrocarbon fuels, especially in diesel or jet fuels. The organopolysiloxane compds. function as foam control agents which display consistent compatibility and miscibility with other fuel additives which are frequently present in hydrocarbon fuels.

AB This invention relates to a new water-soluble lubricant for a medical device, such as a catheter and an introducer needle. The lubricant is a silicone surfactant which is nonionic and which is a good lubricating fluid. Preferably the silicone surfactant that is used is a block copolymer polyalkylene oxide-modified polydimethylsiloxane. Water is used as the solvent for this lubricant. The lubrication solution includes a solution stabilizer to clarify the solution and antimicrobial agents to inhibit microbial growth in the water solution or on the coated product. Vitamin E or its derivs. may also be used in the lubrication solution. When the lubrication solution is used on Teflon products, a small amount of alc. is added to the lubrication solution to increase wettability.

AB In the title process for manufacturing synthetic fibers or plastic films or moldings, an extruded or molded polymer [e.g., polypropylene (I)] melt is quenched by regulating the cooling rate and/or the quenching temperature to obtain a stable structure comprising smectic and amorphous phases or a stable structure comprising smectic, amorphous, and monoclinic phases and heat-treated below the mobilization temperature of the polymer crystalline phase, which corresponds to the temperature for the maximum dynamic loss modulus of the polymer, to increase the monoclinic degree of crystallinity of the polymer matrix and form amorphous and smectic phase portions containing separated polymer-blended additives corresponding to supersatn., and the amorphous layer thickness of the quenched polymer matrix is controlled by regulating the heating time and temperature range defined by the quenching time and temperature corresponding to the min. amorphous layer thickness, without exceeding the temperature at which the return diffusion of the separated additive into the amorphous and smectic matrix phases occurs. A composition containing I and CF3(CF2)7SO2N(CH2Me)CH2CH2(OCH2CH2)8OMe (II) was melt spun, quenched, and heat-treated at 100-110° to give fibers with II content 0.5-1.0% and exhibiting wetting angle 60-65° and a monomol. fluorochem. surface.

IT 183903-69-5

RL: MOA (Modifier or additive use); PEP (Physical, engineering or chemical process); PRP (Properties); PROC (Process); USES (Uses)
 (hydrophilization agent; process for regulating internal transport of additives of polymers for imparting various properties to solidified polymer products)

PRIORITY APPLN. INFO.: JP 1994-290713 19941031 <--

AB The title method comprises a treatment of SiH-containing organic Si compds. with organic compds. having olefinic unsatd. bonds in the presence of catalysts prepared by reaction of (A) PtLa [L = ≥ 1 (amino- or mercapto-substitutable) ligand; a = nos. to balance the free valences of Pt] with (B) $YmXnSi(OR)_p(OH)_q(4-m-n-p)/2$ [Y = R2SbR3; R2 = H, C1-4 alkyl, C2-5 alkenyl, aryl, R3Si(OR)3; R3 = C1-10 (branched) alkylene; b = 1-4; R1 = C1-4 hydrocarbyl; X = R4R5NR3. NCR3; R4, R5 = H, C1-4 alkyl, C2-5 alkenyl, aryl, R4R5NR3, R3Si(OR)3; 0 < m < 1; 0 < n < 0.5; n < m; 0 < m + n < 1; 0 \leq p < 0.1; 0 < q < 1; 0 < m + n + p + q < 2], obtained by treating YSi(OR)3, XSi(OR)3, and Si(OR)4 in H2O or H2O-containing organic solvents in the presence of SiF-containing F-containing Si compds. or fluoride salt catalysts. Thus, mercaptopropyltrimethoxysilane 131.3, γ -phenylaminopropyltrimethoxysilane 84.2, and Si(OMe)4 84.2 g were reacted at room temperature for 5 min to obtain a S- and N-containing organosilane derivative, 10 g of which was then treated with 2.08 g H2PtCl6.6H2O at 60° for 6 h to prepare a catalyst. Then, 93.5 g allyl glycidyl ether and SiH(OMe)3 were heated at 80° for 2 h to give γ -glycidoxypropyltrimethoxysilane in high yield for 10-times repeated use, and the Pt content in the remaining reaction solution was ≤ 0.1 ppm.

AB The title polymers obtained by hydrosilylation of polyoxyalkylenes having C:C bonds at chain ends with hydropolysiloxanes are purified by hydrogenation for reduced odor and good storage stability. Thus, Me₃SiO(Me₂SiO)₂₀(MeHSiO)₅SiMe₃ and CH₂:CHCH₂O(CH₂CH₂O)₂₀(CH₂CHMeO)₁₀Bu were treated to obtain a crude polyether-polysiloxane, which was hydrogenated in PhMe and filtered to give a purified product showing unsatn. degree 0.01 mg-equiv and no odor in hydrolysis by HCl.
